

PRODUCT CONCEPT · AUGUST 2026

TapTime

A trusted, contactless attendance system for
modern workplaces and clinics

Tap in. Tap out. Clear records.

Prepared for founding-team discussion

Initial scope: phone-first attendance · secure hardware · SAGA workflow · iSTOMA
compatibility

01 **The opportunity**

Manual attendance creates avoidable payroll work, uncertainty, and conflict. TapTime turns a physical tap into a verifiable attendance event that employees can see, managers can approve, and accountants can use.

The problem

Late arrivals, early departures, forgotten entries, buddy-punching, and month-end reconstruction.

The product

A fixed workplace reader, phone-first employee credential, secure event service, and clear management dashboard.

The customer value

Less admin, fewer disputes, transparent records, and faster payroll preparation.

The first market

Private clinics and small or medium workplaces with approximately 5–100 employees.

POSITIONING

An attendance and workforce-management tool — not a surveillance product.

The system should create accurate, transparent records for both employees and employers, with visible corrections and an audit trail.

FAST**TRANSPARENT****TAMPER-EVIDENT****PAYROLL-READY**

02 From phone tap to payroll

The value is the trusted chain—not the NFC tap by itself.

ARRIVE → TAP PHONE → CONFIRMATION IN ABOUT A SECOND

01

IDENTIFY

Registered phone or
backup card

02

RECORD

Signed time and reader
location

03

VALIDATE

Exceptions are
automatically flagged

04

APPROVE

Closed report goes to
payroll

The employee does not need to open a timesheet. The workplace controls the trusted reader; the phone supplies the personal credential.

03

What is required on site

The attendance-only MVP does not require replacing doors or installing a turnstile. Mount one reader near the entrance, connect it, enroll employees, and begin recording events.

1

EMPLOYEE PHONE

iPhone or Android phone with NFC and the TapTime app. The app stores a device-bound credential. Provide an NFC card or QR fallback.

2

NFC READER

13.56 MHz reader compatible with ISO/IEC 14443 / ISO-DEP, with an SDK or API, status light/buzzer, and support for secure challenge-response.

3

EDGE CONTROLLER

Small industrial controller—or Raspberry Pi-class device for the prototype—with encrypted storage, Ethernet/Wi-Fi, and an offline event queue.

4

ENCLOSURE + POWER

Wall enclosure, hidden or security fixings, tamper switch, protected 5V/12V supply, cable management, and optional small battery backup.

5

CLOUD SERVICE

API, employee directory, device registry, rules engine, audit log, dashboard, secure backups, and monthly payroll exports.

6

INSTALLATION KIT

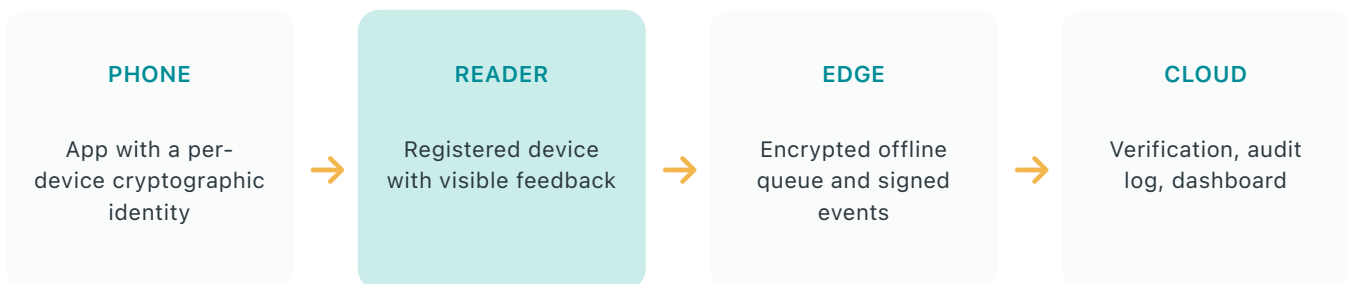

Mounting template, screws/anchors, power cable, network setup instructions, test credential, and a simple enrollment checklist.

Phone NFC capabilities differ by platform and region, so iOS and Android behavior must be validated during the prototype. Android supports host card emulation on compatible devices; Apple documents NFC card sessions for eligible use cases in the EEA.

04 Built as a secure appliance

The MVP may use off-the-shelf parts, but the architecture should already support device identity, offline operation, and tamper detection.

PHYSICAL CHAIN

Tamper resistance

Sealed wall enclosure, hidden fixings, opening switch, locked power, and logged device health.

Authenticity

Device-bound phone key, unique reader certificate, mutual TLS, signed firmware/events, and controlled key management.

Resilience

Encrypted local storage, safe offline queue, automatic synchronization, and no silent history overwrite.

Accountability

Role-based access, visible corrections, immutable audit history, and stronger approval for payroll overrides.

A serious security promise

No connected system is literally “unhackable.” TapTime should promise that unauthorized events are difficult to create, tampering is detectable, and every correction is accountable.

05 **Integration strategy**

Integration claims must be validated with the exact software edition, version, and provider-supported route before being promised to customers.

SAGA · payroll destination

TapTime provides employee ID, normal hours, absences, overtime, and approved corrections. Start with an accountant-approved CSV/XML/report. Investigate direct import or API only after the exact SAGA product and version are confirmed.

iSTOMA · clinic context

Potential uses include staff identity, schedules, and clinic working periods. Ask iSTOMA for an official API or approved import/export method. If unavailable, TapTime remains the attendance source and supplies reports.

PROVIDER CHECKLIST

- 01 Public or partner API available?
- 02 Attendance/pontaj imports supported?
- 03 Exact accepted fields and file format?
- 04 Stable unique employee IDs supported?
- 05 Licensing, certification, or support requirements?

Initial references reviewed: SAGA payroll documentation, iSTOMA public product information, and Brick's official product description. Provider confirmation remains a discovery task.

06

Easy to launch. Easy to measure.

TapTime does not need to prove that every minute is intentional. It needs to make attendance visible, reduce preventable leakage, and remove manual reconstruction from payroll.

ILLUSTRATIVE TIME-RECOVERY SCENARIOS

250 hours / year

One employee leaves one hour early on each of approximately 250 working days.

365 hours / year

The business loses one combined hour every calendar day—for example, a seven-day operation.

625 hours / year

Ten employees lose 15 minutes per working day: $10 \times 0.25 \times 250$.

Simple value formula

Potential labor value = recovered hours × loaded hourly cost

Admin example: reducing 4–8 hours of monthly reconciliation by half saves another 24–48 hours per year.

IMPLEMENTATION — ATTENDANCE-ONLY MVP

DAY 0

Mount reader, connect power/network, create company and administrator.

DAY 1

Enroll phones and fallback cards; test check-in and check-out.

WEEK 1

Run beside the existing process; train managers on exceptions.

MONTH END

Close attendance, approve corrections, export the payroll report.

Illustrative scenarios—not guaranteed savings. Use the pilot to establish the actual baseline and measure current payroll-preparation time before deployment.

07

Prove it in one workplace

The fastest credible route is a small pilot that proves event capture, correction handling, employee acceptance, and payroll usefulness.

1–2 WEEKS

DISCOVERY

Choose a pilot, map rules, confirm SAGA workflow, contact iSTOMA, select hardware.

2–4 WEEKS

PROTOTYPE

Build enrollment, tap events, check-in/out logic, dashboard, and event history.

4 WEEKS

PILOT

Deploy at one entrance, compare records, measure exceptions, and test offline recovery.

2–4 WEEKS

PAYROLL

Finalize reports with the accountant; add approvals, closing, and audit outputs.

AFTER PROOF

SCALE

Add locations, phone credentials, shifts, integrations, billing, and support.

PILOT GATE

≥95% events captured • corrections are auditable • employees can see their records • accountant accepts the output • no critical security or privacy issue remains

TARGET Private clinics and small/medium businesses with 5–100 employees.

CREDENTIAL Phone-first; NFC card or key fob as fallback and for employees without compatible phones.

HARDWARE One fixed reader per entrance, connected by Ethernet or managed Wi-Fi.

MODEL One-time hardware fee plus monthly software fee per location or employee.

FIRST PROOF One functioning pilot and one accountant-approved SAGA report.

IMMEDIATE ACTIONS

- 1 Choose one pilot workplace and document its current attendance process.
- 2 Prototype the phone tap on both iOS and Android; keep card/QR fallback.
- 3 Confirm the exact SAGA edition/version and required payroll fields.
- 4 Ask iSTOMA about official API/import availability.
- 5 Build the pilot before investing in custom hardware.

Trusted physical event → verified attendance → approved payroll
